

ECSBF_v1
Enterprise Concurrent Signal Broadcast Framework

Code compiled using compiler	g++ (Ubuntu 20.04 LTS)	version -(Ubuntu - 20.04.4 LTS)
Compilation flags used	Yes (-std=c++17 -wall)	
Does code compile, without any error and warnings. If there are warnings, please mention those warnings. It is preferred that code is compiled with Insure also.(Optional)	Yes	
Readiness Index	-100.00%	

Guidelines Checkpoints			
Naming Conventions Checkpoints			
S. No.	Checkpoints	Yes/No/NA (Originator)	Comments (Originator)
1	Are all files named according to Guidelines followed?	Yes	
2	Are all symbol names follow the guidelines?	Yes	
3	Are all functions named according to guidelines followed?	Yes	
4	Are all variables named according to guidelines followed?	Yes	
5	Are all constants, literals, enumerations, MACRO names are in Uppercase?	Yes	
Coding Style Checkpoints			
File Organizations			
S.	Checkpoints	Yes/No/NA	Comments (Originator)
1	Does each header file contain provisions to counter erroneous multiple inclusions?	Yes	
2	Do all files have proper and complete file headers according to guidelines followed?	Yes	
Code Commenting & Indentation			
3	Is it ensured that any commented out source code is removed and no #if n source	Yes	
4	Is there any hack /offensive code? If yes, is it commented appropriately with proper	Yes	
5	Do the comments correspond completely to the code and comments are present for	Yes	
6	Are all global variables declared in a module bear the comment explaining the	Yes	
7	Is the code indentation consistent across all files? Also, Comment style used should	Yes	
Functions			
8	Do all functions have complete and up to date Function Headers?	Yes	
9	Is the size of more than 80% (preferably all) functions in the file reviewed less than	Yes	
Code Features			
10	Are all global variable explicitly initialized? Preferably global variables should be	Yes	
11	Is enough preference given to static variables in different files? Similarly functions	Yes	
12	Is the code free from magic numbers (hardcoding)? Only, "0 and 1" are allowed to	Yes	
13	Is it ensured that all variables are initialized explicitly before using the value carried	Yes	
14	Is there any fall through statement in switch ? If yes is it commented?	Yes	
15	Do all if-else statement follow fully-bracketed syntax?	Yes	
16	Is it ensured that there are no floating numerical constants? Or if exist then	Yes	
17	Pointers (or references) have been used as function parameters wherever structures	Yes	
18	Is code free from local variable definitions of large sized array and structures?	Yes	
19	Is NULL used for pointers, 0 for integers and '\0' for strings?	Yes	
20	MACROs are defined with parenthesis enclosing the replacement text. MACROs	Yes	
21	Does code have deterministic memory needs? Has developer estimated and	Yes	
22	Every system and library call (like calls to acquire memory, IPC etc) is checked for	Yes	
23	Basic data types of C shall not be used directly within the code. Instead a layer of	Yes	

Other Checkpoints			
Programming Checkpoints			
S.	Checkpoints	Yes/No/NA	Comments (Originator)
1	Are the conditional loops working correctly for the boundary conditions? (both	Yes	
2	Is code consistent with API document also? (If applicable)	Yes	
3	Are all possible messages / events handled in all states? (specially the error	Yes	
4	Are all data structures chosen for optimum speed/memory behavior?	Yes	
5	Are the Identified corner cases, validating the boundary conditions?	Yes	
Quality Checkpoints			
S.	Checkpoints	Yes/No/NA	Comments (Originator)
1	Is the tracability matrix updated for this piece of code? If yes, provide the path also.	Yes	
2	Has the updated RTM been sent along with source code for review? (RTM should also be a part of the deliverable for review)	Yes	
3	Is any tool used to do the static checking? (For example splint) If yes, provide the	Yes	
4	Is insure/purify used?	No	Valgrind is used instead

Code reviewed against Cppcheck (static analysis) and Valgrind (dynamic analysis).
No critical defects found.
Project ready for integration testing and deployment.
