

Assignment 2: Requirements Gathering

– Community Event Organizer App

Objective:

Conduct a mock 30-minute stakeholder interview to gather requirements for a fictional application that helps organize and manage community events. This document summarizes the gathered requirements and explains how they would be documented and traced.

1. Mock Interview Summary (30 Minutes)

Stakeholders Involved:

- Community Organizer (Primary User)
- Volunteers
- Event Participants

Key Discussion Points:

- Problems in current event planning (manual coordination, lack of visibility)
- Required features for event creation and promotion
- Volunteer coordination and task assignment
- Participant registration and communication
- Reporting and feedback after events

2. Functional Requirements

FR1: Users shall be able to create and publish community events.

FR2: Users shall be able to view upcoming and past events.

FR3: Participants shall be able to register for events.

FR4: Organizers shall be able to assign tasks to volunteers.

FR5: The system shall send notifications and reminders.

FR6: Users shall be able to provide feedback after events.

3. Non-Functional Requirements

NFR1: The application shall be user-friendly and intuitive.

NFR2: The system shall support at least 1,000 concurrent users.

NFR3: Data shall be stored securely with role-based access.

NFR4: The application shall be available 99.5% of the time.

4. Assumptions and Constraints

Assumptions:

- Users have internet access.
- Events are community-based and non-commercial.

Constraints:

- Limited initial budget.
- Mobile and web platforms only.

5. Documentation and Requirement Traceability

Documentation:

- Requirements will be documented in a Software Requirements Specification (SRS).
- Use cases and user stories will be created for each functional requirement.

Traceability:

- A Requirement Traceability Matrix (RTM) will map requirements to design, development, and test cases.
- Each requirement will have a unique ID (FR/NFR).
- Changes will be tracked using version control and change logs.

Conclusion:

This requirements gathering process ensures stakeholder needs are clearly understood, documented, and traceable throughout the software development lifecycle.
